

Signs of Septic System Failure

How Do I Know If I Have A Problem With My Septic System?

ISSUES IN THE HOME

- Unpleasant odors in your home
- Decreased flushing of your toilets
- Decreased drain flow from showers and sinks
- Backup of sewage in your drains or toilets – often a blackish type of liquid with a disagreeable odor.

ISSUES WITH YOUR TANK

- Over-flowing or near over-flowing septic tank
- High solids accumulation in the septic tank

ISSUES WITH THE LEACH-FIELD & SURROUNDING ENVIRONMENT

- Water accumulating / wet patches in the leach field
- Lush green grass through-out the year, especially if the surrounding garden is significantly different.
- Presence of contamination (e.g. nitrates, bacteria) in your well water is potentially a major health hazard and is a very clear indication that your septic system is not performing adequately.
- Accumulation of algae and aquatic weeds in adjacent lakes, ponds, streams is a clear indication that your septic system is under performing and contaminants / nutrients are migrating from your septic system.

Little Problems Can Quickly Turn Into Big Problems!

*If you suspect issues with your septic system, call Hulsey Plumbing!
We will inspect your system and give you peace of mind.*
